Magnetic resonance cholangiopancreatography (MRCP) is a relatively new non-invasive technique for imaging the pancreatico-biliary system and avoids the significant invasiveness of Endoscopic Retrograde Cholangiopancreatography (ERCP). MRCP has been widely used as a useful non-invasive tool for the evaluation of biliary and pancreatic pathology, and its diagnostic ability has been significantly improved since its introduction in 1991.

Chronic pancreatitis has never been documented in a large prospective controlled study, but it is known to have a significant impact on quality of life. Magnetic resonance cholangiopancreatography (MRCP) has evolved rapidly over the last two decades as it is non-invasive, does not require anesthesia or contrast enhancing material, and is less operator dependent than ERCP.

Magnetic resonance cholangiopancreatography (MRCP) uses a powerful magnetic field to evaluate the disorders of liver, gallbladder, bile ducts, pancreas, and pancreatic duct. This technique was introduced in 1991, and since then, it has revolutionized the evaluation of the biliary tree and pancreatic ducts.

Role of Magnetic Resonance Cholangiopancreatography

Magnetic resonance cholangiopancreatography (MRCP) is a new non-invasive modality that shows fluid in the biliary and pancreatic ducts in an axial or three-dimensional image format, which can be parceled in appearance and diagnostic accuracy to radiographic techniques seen with direct contrast endoscopic retrograde cholangiopancreatography (ERCP).

Magnetic resonance cholangiopancreatography (MRCP) is a new non-invasive modality that shows fluid in the biliary and pancreatic ducts in an axial or three-dimensional image format, which can be parceled in appearance and diagnostic accuracy to radiographic techniques seen with direct contrast endoscopic retrograde cholangiopancreatography (ERCP). This technique was introduced in 1991, and since then, it has revolutionized the evaluation of the biliary tree and pancreatic ducts.

Magnetic resonance cholangiopancreatography (MRCP) is a relatively new non-invasive technique for imaging the pancreatico-biliary system and avoids the significant invasiveness of Endoscopic Retrograde Cholangiopancreatography (ERCP). MRCP has been widely used as a useful non-invasive tool for the evaluation of biliary and pancreatic pathology, and its diagnostic ability has been significantly improved since its introduction in 1991.
May 20th, 2020 - Since the first clinical application of Magnetic Resonance Cholangiopancreatography (MRCP) in the early 1990s, MRCP has evolved from a technique with questionable potential for imaging the biliary tract and pancreatic duct to one that is now recognized as a pivotal tool for diagnosis of pancreaticobiliary disease.

May 16th, 2020 - This book, based on the experience of a single large referral center, presents the characteristic findings obtained when using MR imaging and MR Cholangiopancreatography (MRCP) to image the biliary tree and pancreatic ducts in a variety of disease settings. An introductory chapter is devoted to technical considerations, anatomy, and developmental anomalies.

May 19th, 2020 - The purpose of this study was to determine the yield of magnetic resonance cholangiopancreatography (MRCP) in asymptomatic patients with an incidental finding of biliary duct dilatation. The study included 68 consecutive patients for evaluation of biliary duct dilatation found incidentally on computed tomography (CT) or ultrasound (US). MRCP is a special type of magnetic resonance imaging (MRI) exam that produces detailed images of the hepatobiliary and pancreatic systems including the liver, gallbladder, biliary ducts, pancreas, and pancreatic duct.
